

JOUR 4251

Psychology of Advertising

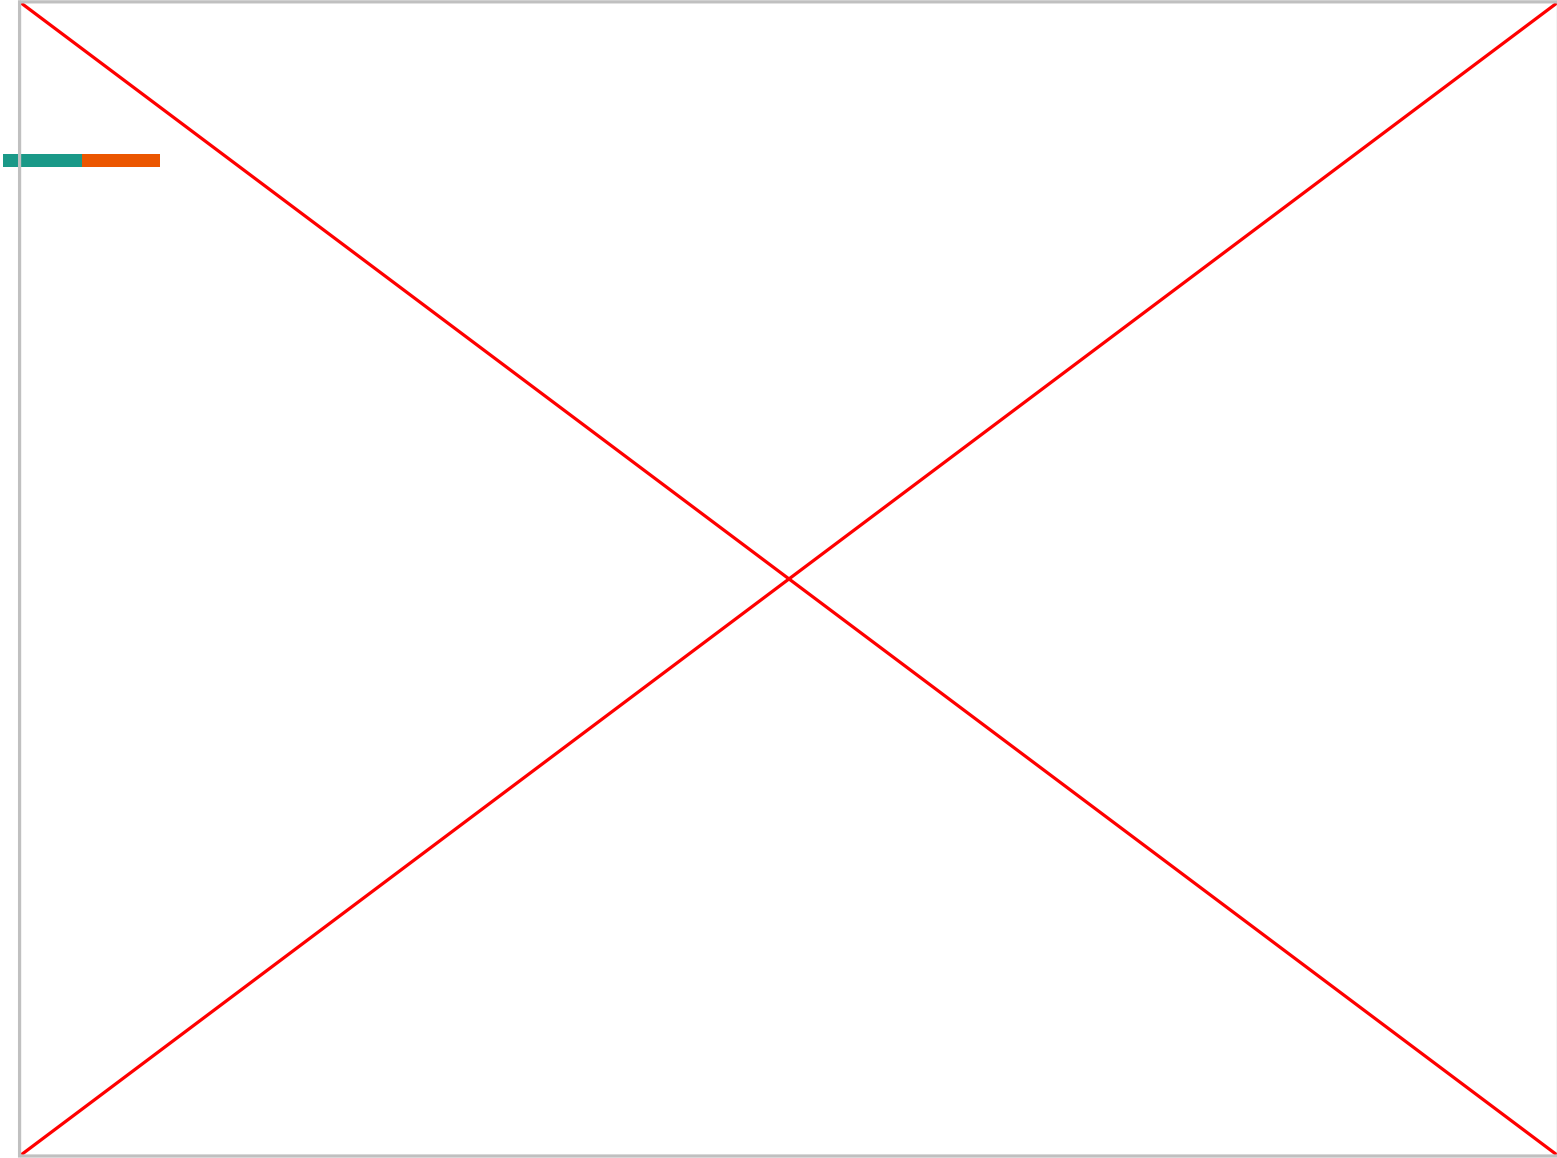

4.1 Memory (continued)

Date	Topic	Reading	Deadlines (Thursdays before class)
Week 1	Jan-21 Course introduction	Syllabus	
	Jan-23 The functions of advertising Introduction to psychology	Start reading Chapter 1	
Week 2	Jan-28 The functions of advertising (cont.) Introduction to psychology (cont.)	Ch. 1	Reading response #1 Assignment #1 (personal statement)
	Jan-30 Attention, perception, processing		
Week 3	Feb-04 Attention, perception, processing (cont.)	Ch. 2	Reading response #2
	Feb-06 Advertising effects on memory		
Week 4	Feb-11 Advertising effects on memory (cont.) Feb-13 Attitudes toward advertising and the brand	Ch. 3	Assignment #2 (attention) Reading response #3
Week 5	Feb-18 Attitudes toward advertising and the brand (cont.) Feb-20 Attitudes toward advertising and the brand (cont.)	Ch. 4	Submit review question #1 Reading response #4
Week 6	Feb-25 Review session Feb-27 EXAM 1 (in class)	Catch-up with readings	

Recap Thursday

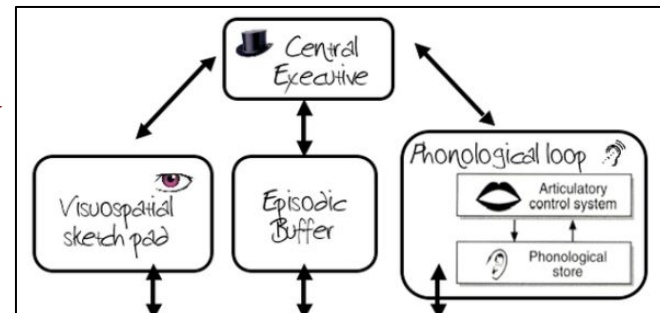

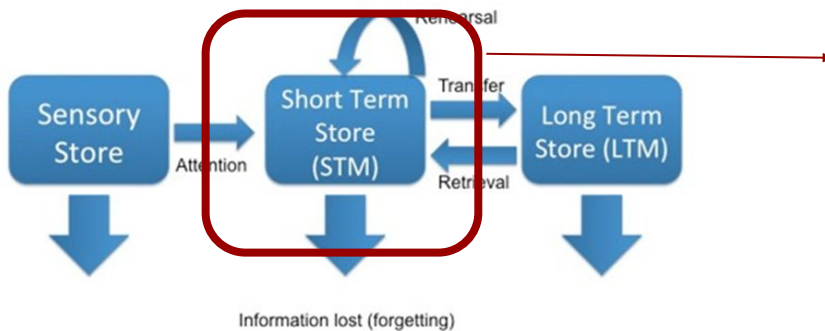

- Memory
 - Encoding
 - Storage
 - Retrieval
 - Forgetting
- Multi-store model of memory
 - Sensory memory
 - Short-term (working memory)
 - Long-term memory
 - Controversy
 - Depth of processing
 - Repetition is not enough
 - Semantic processing

Baddeley and Hitch model

Replaced the concept of short-term memory (working memory): Instead of one system, it was a multi-component system

The multi-store model of memory
(Atkinson & Shiffrin, 1968)

Baddeley and Hitch model

Replaced the concept of short-term memory (working memory): Instead of one system, it was a multi-component system

Central executive system

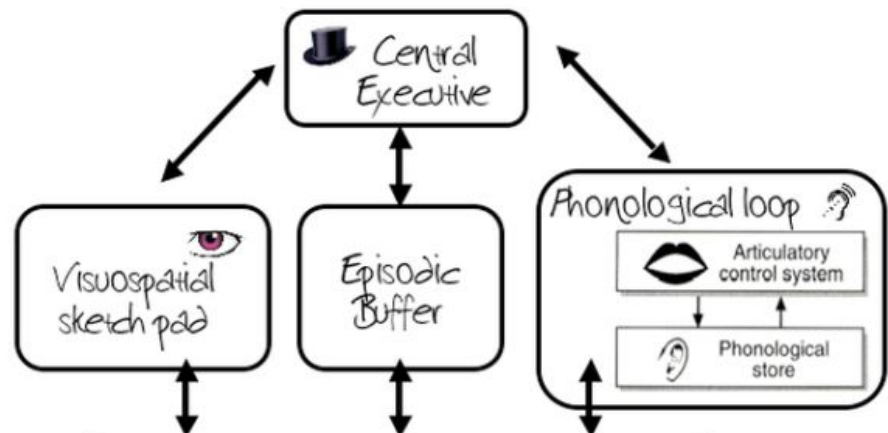

Controls a bunch of subsystems

Two subsystems are:

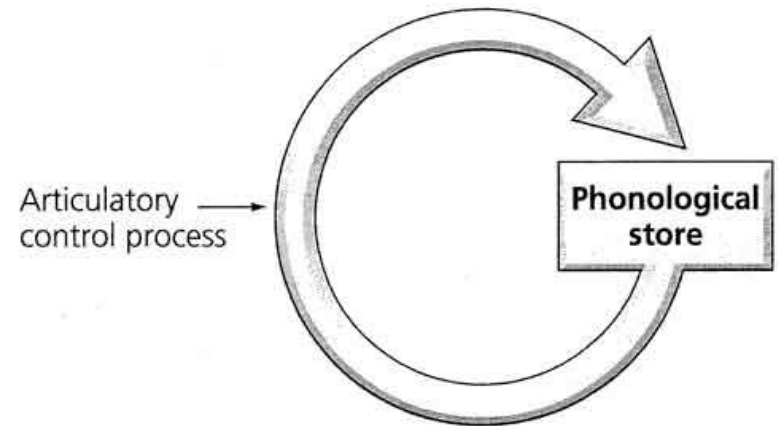

1. Phonological loop
2. Visuospatial sketchpad

Episodic buffer:

the place where info from long-term memory is integrated with working memory and manipulated. Where the brands live!

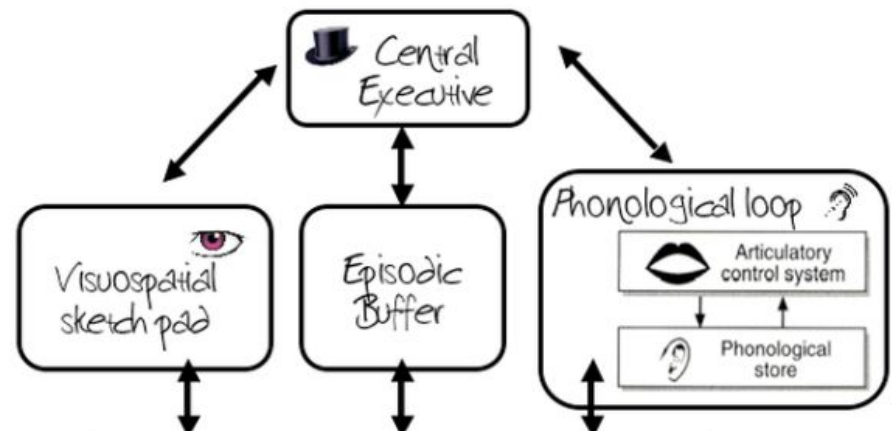

Phonological loop

Two parts

- Phonological store: holds sound or speech-based info
- Rehearsal system that uses “inner speech”

Limited amount you can remember

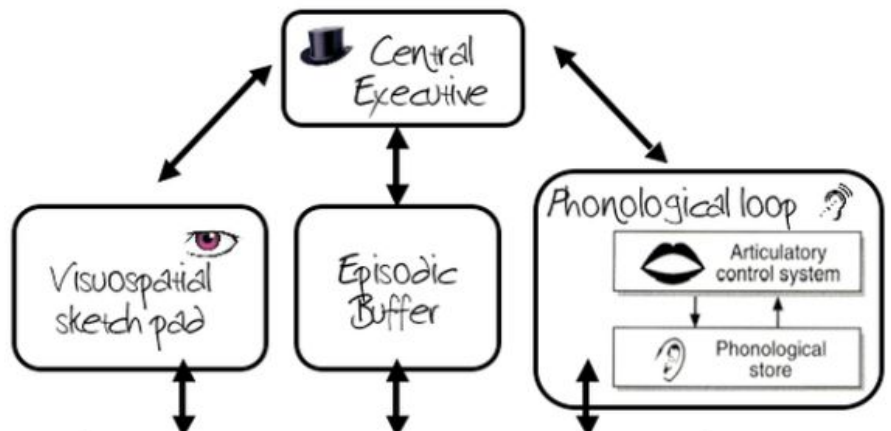

Visuospatial sketchpad

Brief storage and manipulation of visual information

Spatial orientation

Solves visuospatial problems

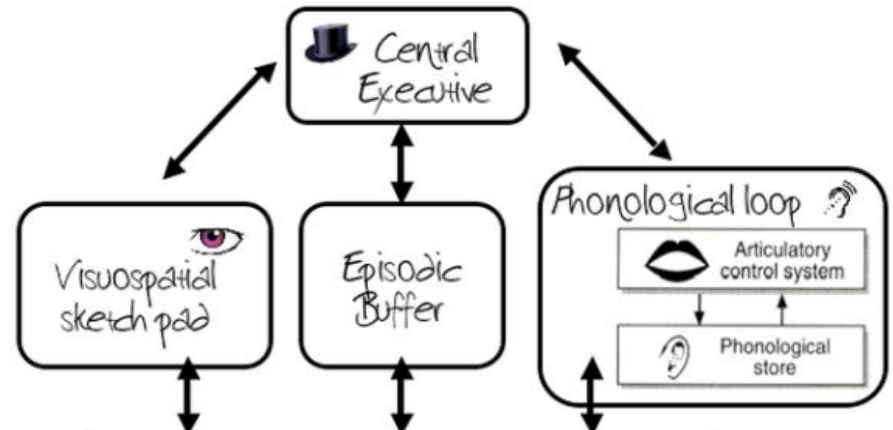

Central executive

Allocates attention and coordinates the two systems

Focuses the available attention

No storage capacity: just manages how and where the information is stored

Episodic buffer

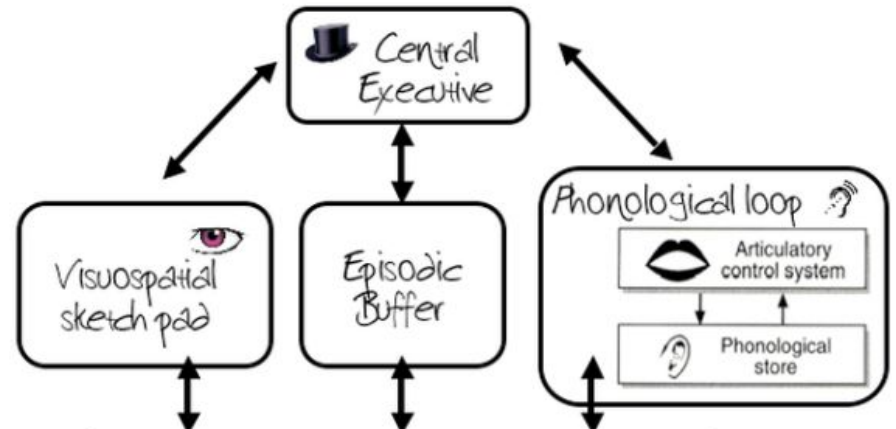

Integrates info from different sources

Limited capacity, temporary storage

Controlled by the central executive

Long-term and short-term memory can be integrated, manipulated

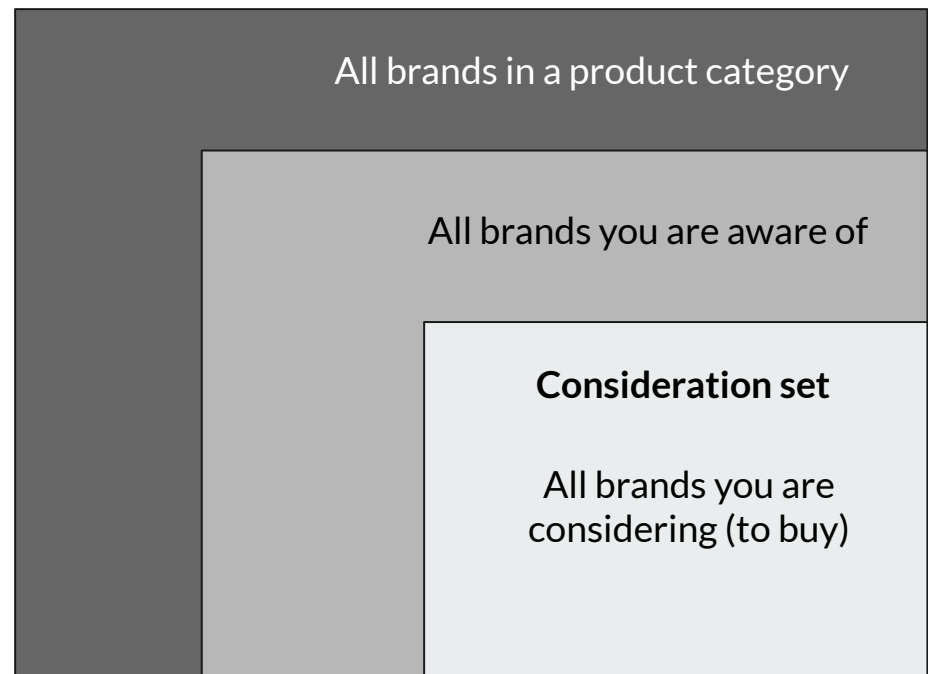

Consumer consideration set lives here!

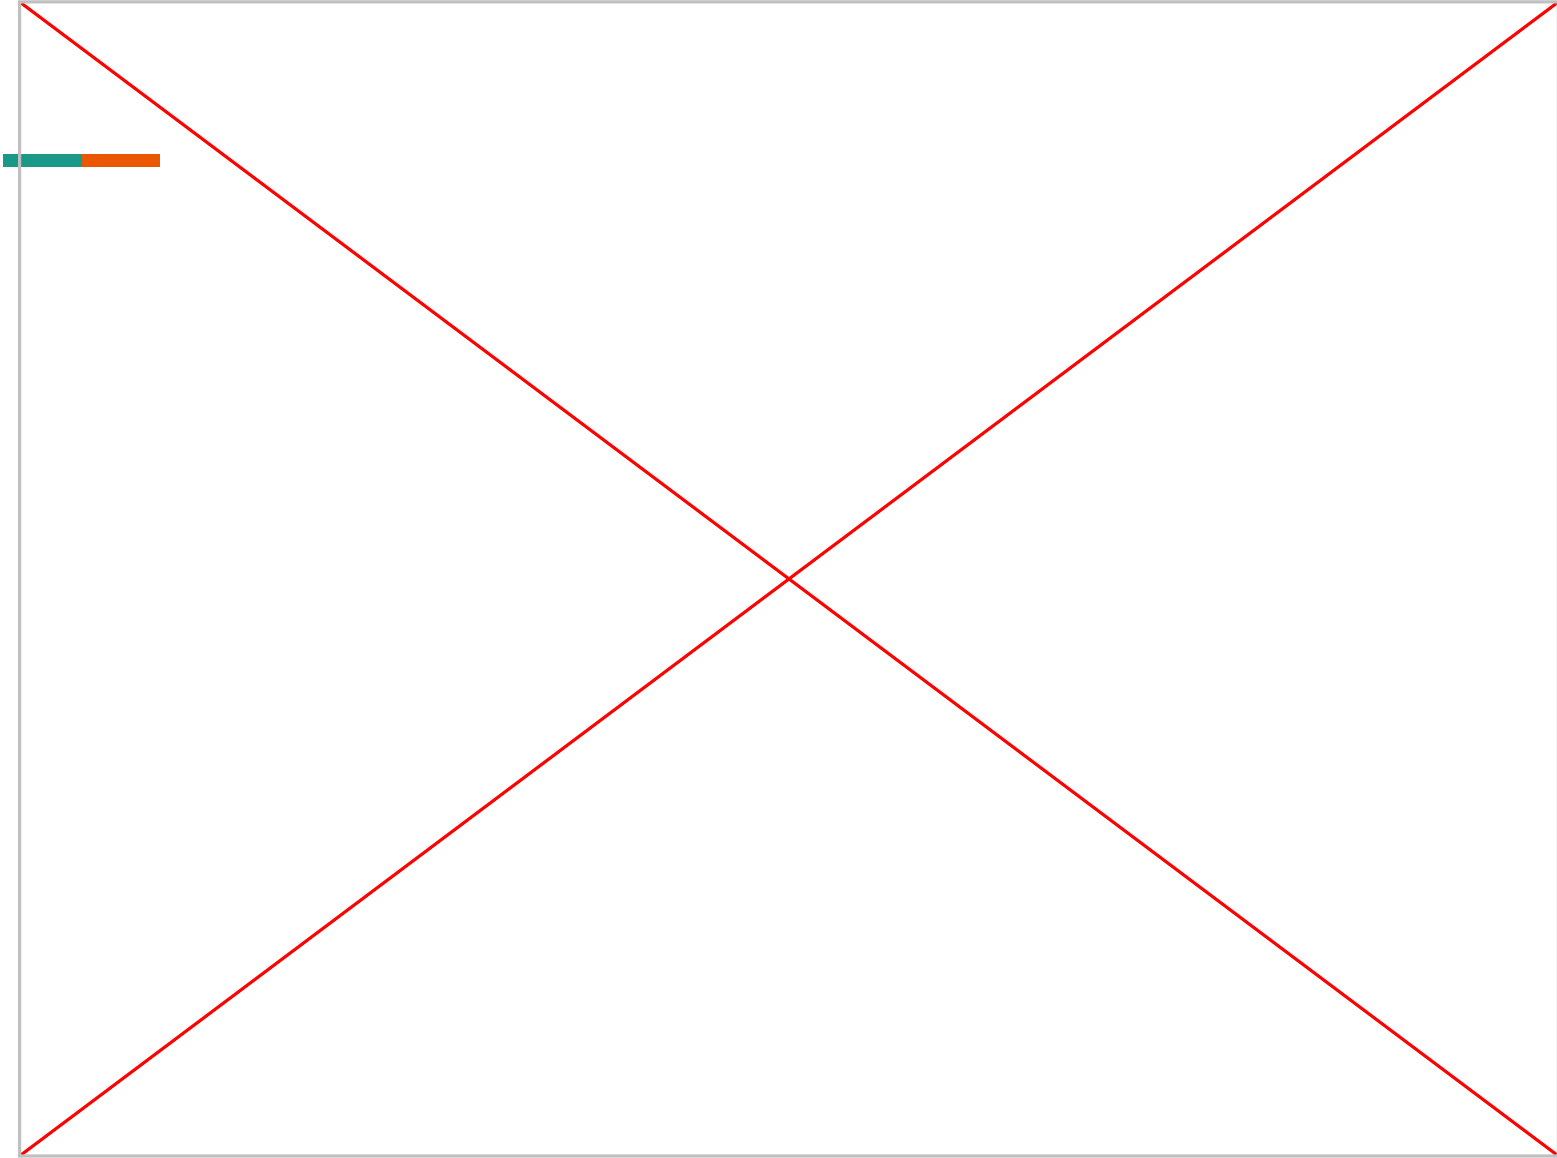

Consideration set

Number of brands from any given category that get referenced.

Baddeley and Hitch model

Replaced the concept of short-term memory (working memory): Instead of one system, it was a multi-component system

Central executive system

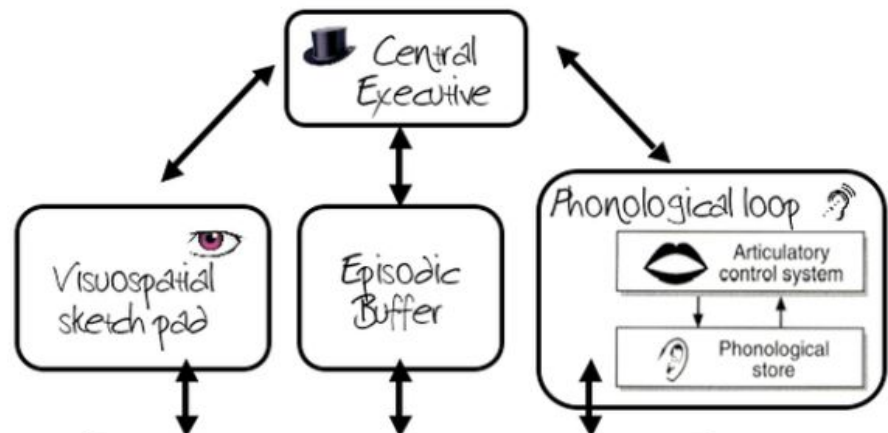

Controls a bunch of subsystems

Two subsystems are:

1. Phonological loop
2. Visuospatial sketchpad

Episodic buffer:

the place where info from long-term memory is integrated with working memory and manipulated. Where the brands live!

Long term memory

INFINITE

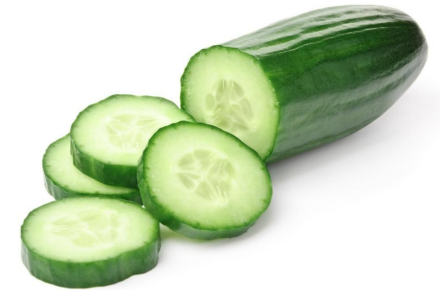

Composed of several departments

Distinction between:

- Conscious / explicit (declarative, recollective)
- Nonconscious / implicit

Explicit memory

Two types:

1. Semantic

- Organized knowledge you have about words and meaning
- Abstracted words and concepts and rules stored in your head
- Facts, ideas, meaning, and concepts

2. Episodic

- About an event that occurred at time and place
- Experiences, specific events
- Your memory about brand X's new product

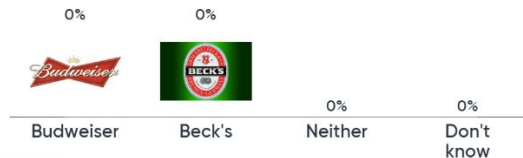

Cats vs Cucumbers

What brands do you remember from the ads (videos only) shown in JOUR 4251 up to today?

Three problems:

- Of which of these two brands did I show you an advertisement in one of the previous classes?
- | | | | |
|---|---|---------|------------|
| 0% | 0% | | |
|  |  | | |
| Budweiser | Beck's | Neither | Don't know |

Implicit memory

Exposure to ads: goes into implicit memory and you have no idea.

Previous experience facilitates performance on subsequent tasks.

How do you measure something that people cannot consciously remember?

Implicit memory measures

They measure whether people's performance on a seemingly unrelated task has improved as a result of having experienced a prior event.

For example, people are NOT asked to recollect the words or ads they have previously seen, but they are asked to report the first word or brand that comes to mind.

Thus, implicit measures do not explicitly refer to a prior experience and do not require conscious or intentional recollection of this experience

Implicit memory

Word fragment identification task

L_RP_

BU__R

Brand name generation task

Came up with as many brands
as possible for product types
during 45 seconds

Lexical decision task

WORD

NON WORD

Butter

Lexical decision task

WORD

NON WORD

Flweor

Priming

Refers to the phenomenon that exposure to an object or a word in one context increases the accessibility of the mental representation of that object or word

Supraliminal priming: priming task is conscious

Subliminal priming: priming task is nonconscious

This is how you can remember it:

Latin

Supra = above

Sub = below (submarine = below sea)

How is long-term memory organized?

Categories

Remember this is important for advertisers as they position their brands

Scripts

Sequence of events. What is supposed to happen here.

Scripts are different in some locations than others.

Examples: restaurant / store / bus

Nodes

Networked memory models

Priming + network => advertising?

Increasing cognitive accessibility of brand names influence the inclusion of brand in consideration set, not purchase.

It influences brand choice (purchase) when:

- 1) Consumers have no particular preference
- 2) Preferred brand is not available

Forgetting the message

Memory fades with the passage of time

Competing information: new info can interfere with old information

Factors that influence the effect of clutter on forgetting ads:

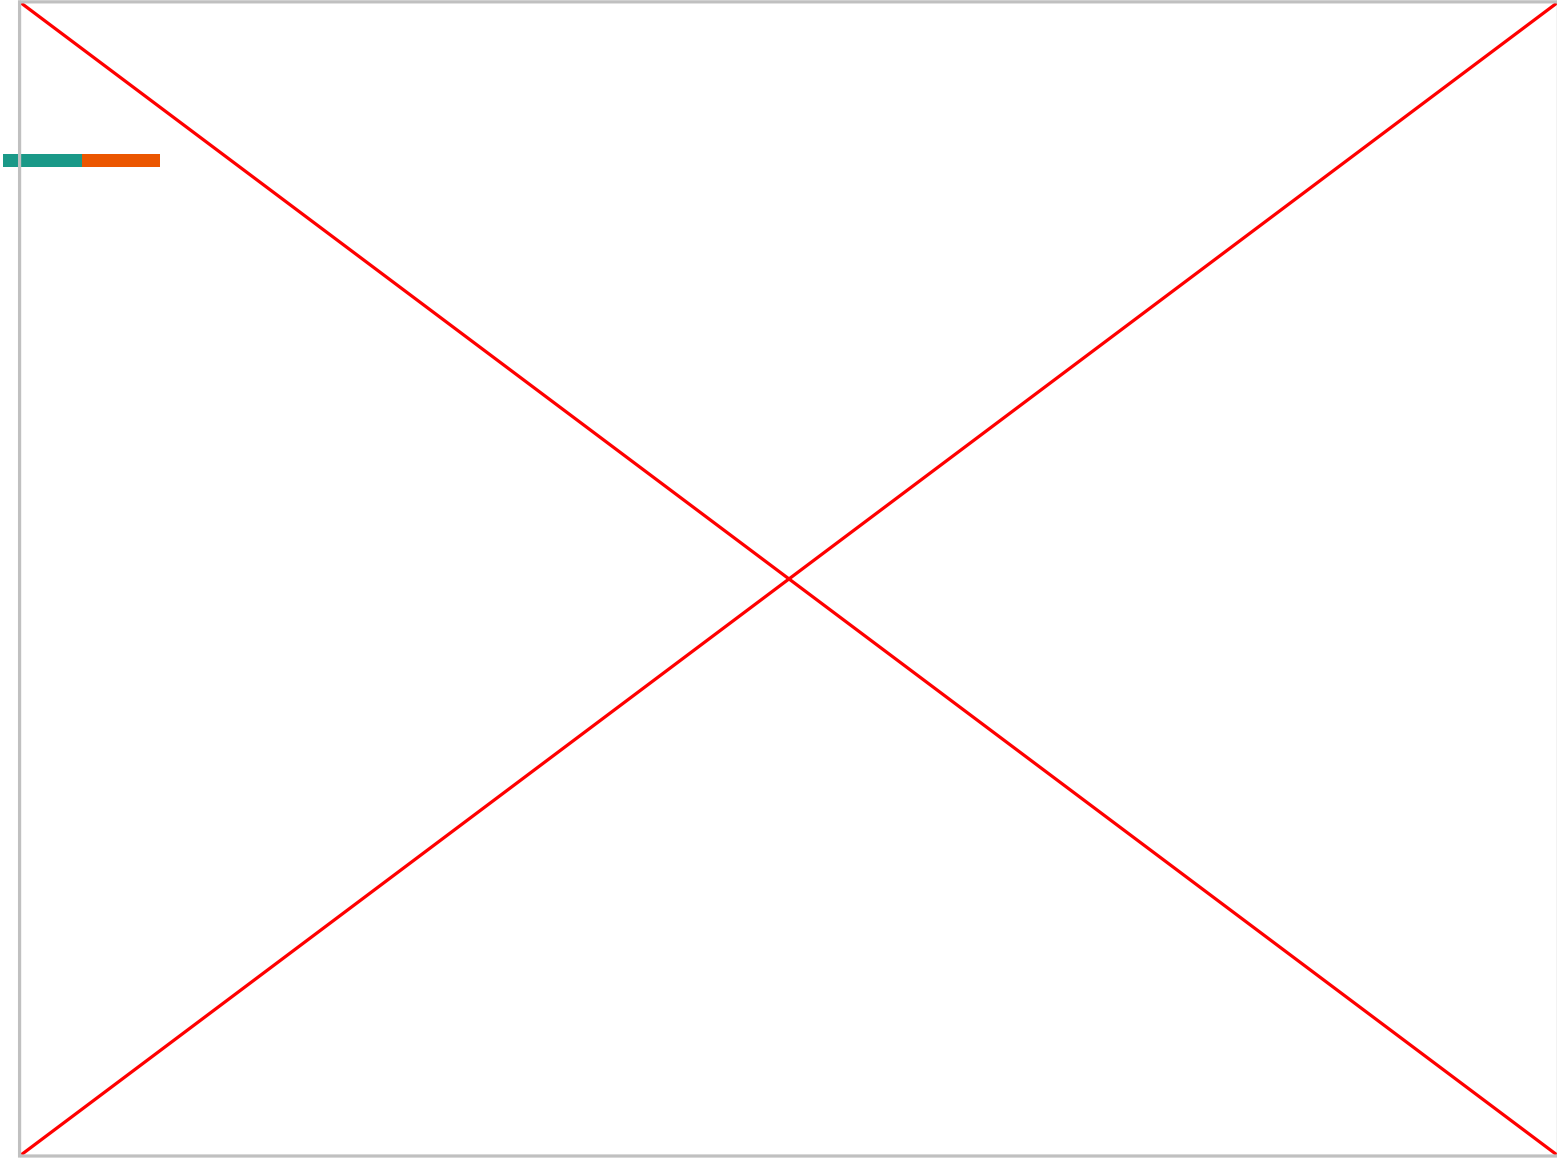

1. The person's goal when processing the original advert and the new ones
2. Brand familiarity

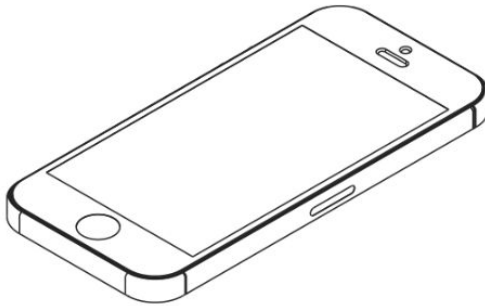

Remembering the message

Advertisers use lots of strategies to get you to remember:

- **Retrieval cues**
 - Same images as in advertisements (with variations)
- **Repetition of advertisements and spacing:**
 - considered a good strategy but really relates to attitudes not memory. Spacing the repetitions out will help recall.
- **Primacy and recency effects**
 - First / last commercial

www.menti.com

2

Go to www.menti.com

What's next?

The following things are due **February 13 (before class starts!)**:

- Submit reading response 3 on Chapter 3 (memory)
- Assignment 2 (attention)
 - Hand in on Canvas: Upload Word/PDF document
- Let us know if you need a laptop for Exam 1
 - Email your TA

Also:

- Start reading Chapter 4 (attitude) when you have submitted RS #3.
 - Reading response #4 is due **February 20** (before class starts)
