Media multitasking / Multiscreening

Multitasking

PERCENTAGE OF U.S. CONSUMERS WHO MULTITASK WHILE WATCHING TV

Ninety percent of consumers are multitasking while watching TV. On average, Millennials and Xers are doing three additional activities while watching TV, typically surfing the web, emailing, texting, or social networking.

Question: Which are things you typically do while watching your home TV?

ICA 3a. Can you really multitask?

Consequences for advertisers?

Why attention is the world's most valuable resource

29 JULY 2016 ⌚ 2 MIN READ

After attending the 2016 Cannes Lions, Paul MacGregor discusses the attention economy, and ponders how brands can attract, convert and measure attention.

Attention is the new economy. It is the world's most valuable resource. You shape hearts and minds only with attention. I think that is where the market will swing back to.

Consequences for advertisers?

- Consistent finding in the literature that multitasking has a **negative** effect on memory
- Mixed results on brand attitude
 - Positive effects on attitude: resistance
 - Negative effects on attitude: recognition
 - No results

Experiment 2

What did we expect?

Think like an advertiser (or broadcaster)

What can you do with this information?

Related Multiscreening as a Strategy to Retain Audiences and Increase Persuasion During a Commercial Break

Claire M. Segijn¹, Theo Araujo², Hilde A. M. Voorveld,
and Edith G. Smit³

The aim of the study was to deepen our understanding of how related multi-screening affects audience memory and persuasion. A survey was administered after a live television show. The results showed that the higher the perceived relatedness of the multi-screen activity, the more persuasive the message. This effect was mediated by subsequent attention to television content, program involvement, and attention to the commercial break. The model was replicated for three different multiscreen activities: social media use, chatting, and information search. Furthermore, it was found that related multiscreening increased the likelihood of respondents staying tuned to the television after the show.
